生物材料转化电子杂志 (英文)

Volume 3 Issue 1 March 2022

Application of Stem Cells in Translational Medicine Stem Cells - Part II

Bone Marrow Stromal Cells/Skeletal Stem Cells

Biological basis of cell heterogeneity and differentiation potentials

Haematopoietic Stem and Progenitor Cells

Distinct microenvironmental niches determine cell fate

Oral Stem Cells

Decoding & mapping the different stem cell lineages

ISSN 2096-112X

CN 11-9367/R

Biomaterials Translational is an electronic journal, which will be printed on demand of readers.

Albeit not the 'Balm of Gilead' bringing magical, universal cures to all diseases, stem cell technology plays a central role in the development of functional biomaterials for translational applications.

Cover image: by Florence R. Wang

Biomaterials Translational is an international journal publishing research at the interface of translational medicine, biomaterials science and engineering. The journal publishes original, high-quality, peer-reviewed papers including original research articles, reviews, viewpoints and comments. Translational medicine is an interdisciplinary field that applies emerging new technologies and sciences to the prevention, diagnosis and treatment of human disease, with a particular focus on animal disease models in the application of biomaterials for treatments. Thus, the journal highlights breakthrough discoveries in basic science and clinical application of biomaterials, as well as other significant findings related to the translation of biomaterials.

The scope of the journal covers a wide range of physical, biological and chemical sciences that underpin the design of biomaterials and the clinical disciplines in which they are used.

Original articles will be considered for publication within, but not limited to, the following domains:

- Investigation of human biology and pathogenesis of diseases with potential applications of biomaterials in treatment
- Synthesis, characterization and biomedical potential of metallic, ceramic, polymeric, composite and hybrid biomaterials
- Physical, chemical, biological, pharmaceutical and toxicological features of biomaterials
- Drug and gene delivery system design, with a focus on its application to disease conditions
- Short-term and long-term biocompatibility of biomaterials
- *In vivo* disease models and the biology of the host response in application of novel biomaterials
- Biomaterials design for modern diagnosis and therapeutic clinical practice (bioimaging, biosensing, biotherapy)
- Stem cell-biomaterial-based tissue engineering

THE FIRST EDITORIAL BOARD

Honorary Editors-in-Chief *

Xiaobing Fu, Chinese PLA General Hospital, China
James T. Triffitt, University of Oxford, UK
Yingjun Wang, South China University of Technology, China
Yingze Zhang, Hebei Medical University, China

Editors-in-Chief

Zengwu Shao, Huazhong University of Science and Technology, China
Xu Cao, Johns Hopkins University, USA
Qian Wang, University of South Carolina, USA

Associate Editors

Zhidao Xia, Swansea University, UK
Bin Li, Soochow University, China

Managing Editors

Ronghua Yao, **Weihua Xu**

Biomaterials Translational

CONTENTS

Quarterly Established in December 2020. Volume 3, Issue 1 March 28, 2022

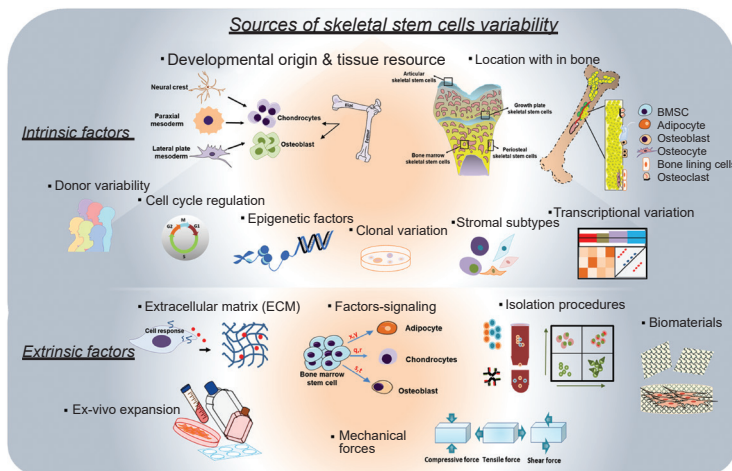

SPECIAL ISSUE

1 Stem cell fate and microenvironment

James T. Triffitt, Qian Wang

3 Recent updates on the biological basis of heterogeneity in bone marrow stromal cells/skeletal stem cells

Deepika Arora, Pamela Gehron Robey

Heterogeneity in BMSCs/skeletal stem cells still remains a long-standing challenge in developing successful and reproducible tissue grafts for applications. Understanding the molecular basis of heterogeneity in skeletal stem cells is critical and so far, several intrinsic and extrinsic factors that may account for the heterogeneity have been put forth.

17 Mesenchymal stem cell differentiation and usage for biotechnology applications: tissue engineering and food manufacturing

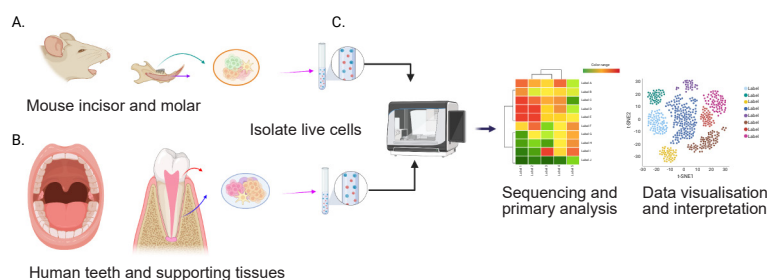

Dafna Benayahu

Schematic illustration of mesenchymal cells, which can differentiate into various lineages, along with a scaffold which can serve as building blocks. The use of cells and scaffold in biotechnology approaches combined with fermentation in bioreactors can result in the large-scale mass production needed for tissue regenerative or food tech applications.

24 Oral stem cells, decoding and mapping the resident cells populations

Xuechen Zhang, Ana Justo Caetano, Paul T. Sharpe, Ana Angelova Volponi

Teeth and their supporting oral tissues harbour diverse populations of stem cells that are easily accessible. The recent advancements in studying these cells in mouse models (A), as well as different human oral tissues (B), by using cell-sequencing approaches (C) reveal complex cellular architecture of different oral tissues, offering a deeper understanding of the underlying mechanisms that drive homeostasis, repair, and regeneration.

31 **The long and winding road: homeostatic and disordered haematopoietic microenvironmental niches: a narrative review**

Suzanne M. Watt

Some key cellular components of adult bone marrow microenvironmental haematopoietic stem cell (HSC) peri-sinusoidal niches are depicted on the left. C-X-C motif chemokine ligand 12 (CXCL-12) abundant reticular stromal cells are important elements of the HSC peri-sinusoidal niche, producing key cytokines and chemokines for HSC retention, and homeostatic regulation of HSC fate. Dysregulation of perivascular/endosteal niches and haematopoiesis occurs with acute or chronic inflammation or inflamm-ageing as shown on the right. The haematopoietic decline observed with ageing is potentially reversible by blocking or controlling inflamm-ageing or by reactivating skeletal stem cells.

55 **An update of nanotopographical surfaces in modulating stem cell fate: a narrative review**

Shuqin Cao, Quan Yuan

Three different types of nanotopographic structures and their fabrication are discussed, namely, static patterned surface, dynamic patterned surface, and roughness surface. The application of these nanotopographical features in modulating stem cell fate are illustrated, furthermore, their future perspective in fundamental research and clinical application are also discussed.

65 **Manufacturing artificial bone allografts: a perspective**

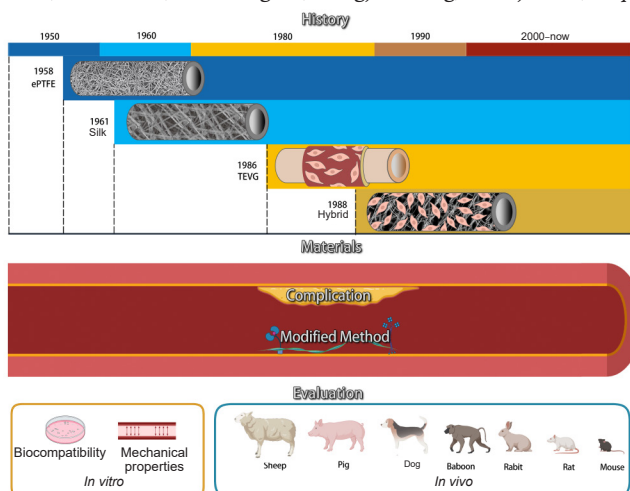

Emma Steijvers, Armaan Ghei, Zhidao Xia

Potential manufacture of artificial bone grafts in two steps: (1) Engineering biodegradable synthetic bone-like scaffolds using allogenic human osteogenic stem cells *in vitro*. (2) Removing living cells to form the end product substantially equivalent to bone allograft.

81 **History, progress and future challenges of artificial blood vessels: a narrative review**

Ke Hu, Yuxuan Li, Zunxiang Ke, Hongjun Yang, Chanjun Lu, Yiqing Li, Yi Guo, Weici Wang

During the development of artificial blood vessels, various materials and manufacturing methods have been continuously explored, and modifications can be made to improve the causes of failure. Through *in vitro* and *in vivo* evaluation, we will eventually select the ideal artificial blood vessel.
